                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mal00610
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ma100620
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ma100640
                                                                                                                                                                                                                                                                                                   on entry: no. of equations (including constraints).
on entry: no. of unknowns.
on entry: no. of constraints.
on entry: nolds the matrix of the equations; on return: holds
the triangularized mutrix and transformations; size: m*n.
on entry: first dimension of a.
on entry: holds right hand side; on return: transformed right
hand side (or optionally the residuals); size: m.
                                                                                                                          the variance-covariance matrix and an estimate of the residual variance is provided by the centry.
                                                linear least squares problem optionally with linear equality constraints, the problem is presented as m linear equations in n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mal4b an entry for supplying a new right hand side to a system
                                                                               unknowns, the first ml equations defining the constraints, additional right hand sides may be passed through a b entry
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of equations solved previously, the variables m,n,ml,a,ia,lw

event.h

· External interface and defines to input-queue event handling event.h routines.

Written by Wade Olsen for Silicon Graphics, Inc.

The event handler understands two kinds of things; events and updates. Events are reactions to things occuring in the input queue. Updates are functions that should be called whenever there is nothing waiting in the input queue, and may be active or inactive. If there are no active updates and nothing in the input queue, then event() will block, using up no CPU time.

are used to identify which event to look for. The first argument is the window (gld) the event must happen in, if this value is ANY then any window will do. The second argument is the device to look for (e.g. RIGHTHOUSE or REDAM or KEYBD, etc). Again, if it is ANY then any device will match. The third argument is the value the device must generate (e.g. DOWN or UP); ANY means all values ratch. The last two arguments are what should be done when an event is generated. The fourth argument is a function to be called, and the fifth is an argument that should be supplied to the function. In addition, the value generated by the device will also be passed to the function when it is called. The first three arguments add event is used to look for events.

for example,

add_event(winget(), RIGHTMOUSE, DOWN, dopup, my_menus); qdevice(RIGHTMOUSE);

will make a pop-up menu appear when the right mousebutton goes down. Note that you must do the qdevice () call yourself.

old add_event(int, int, int, vold (*fn) (vold *, int), char *);

An update is like an event, only simpler. The first argument is a pointer to an integer flag specifying whether or not this update function is active. The second is a function to be called when it is active, and the last is an argument to be supplied to the

old add_update(int *, void (*fn) (void *), char *);

Finally, when all updates and events have been added, repeatedly call event() to handle them -- something like

while (quitfiag == FALSE) event ();

You should have previously added an event that sets quitflag to

TAUE, of course.

oid event (vold) ;

These are some useful defines for the possible values buttons can generate.

~ ° tefine UP teffine ANY

And a few external variab.es you might find useful
